SEO Company Due Diligence: Black Hat Risk Comparison Matrix

Research Guide | 2026 | BlackHatSEO.co.in

Overview

A company comparison should distinguish legitimate technical SEO work from tactics that introduce hidden dependency or search-policy exposure.

Practical checklist

Score prospective providers using evidence of delivery, contract clarity, technical competence and accountability for corrective work.

Evidence and baseline

Define the intended outcome, document the existing metrics, and collect dated evidence from search performance reports and page audits.

Review methodology

Separate marketing claims from independently verified changes. Assess search intent, content usefulness, link practices, accessibility, ownership, and the ability to reverse changes.

Risk and quality controls

Record responsibilities, confirm policy implications, and review the long-term maintenance cost before launching any campaign.

Reporting and follow-up

Set a regular review cycle and compare qualified results with the original baseline. Avoid treating rankings alone as proof of success.
